

## Why Use ICC's Patented Aerial Infrared Moisture Survey

1. Our reports provide an overview of the entire roof from a low altitude.
2. The entire roof surface is surveyed at the same time of night, allowing for unique imaging for benchmarking overall conditions.
3. Our reports quickly identify major wet areas on poor condition roofs, thereby reducing physical inspection time.
4. Projects with multiple locations are quickly assessed.
5. Our reports include daytime aerial photographs that map the entire roof from all compass directions.
6. Thermograms (infrared images) and daytime photos are composed or married for easy identification of roof areas using our patented products.
7. Digital video and photo imaging is edited by our staff.
8. Our clients relay that our patented process results in an accuracy rating of 98%. There will always be a less expensive service, but without our patented process, you may be purchasing a product filled with errors and false positives from the equipment.
9. Deliverables include paper report, electronic report, and web-based report.
10. There are few services that offer a return on investment (ROI) that ICC hears from our clients. Identifying true needs instead of relying on best guesses targets time, labor, and materials to your most urgent needs.

*Pricing may vary by region, depending on per hour cost of flight time and the size of the project. Please call ICC for a quotation.*
